

Hybrid-Intermediate Storage-Systems – **HISS**

In order to meet our customers' requirements, the Customised **Hybrid-Intermediate-Storage Systems** solution by Dücker and Westfalia brings together the well-approved various **intermediate storage solutions** by **Dücker** and the **floor-free high-bay storage solutions** by **Westfalia**.

Individual project evaluation according to the facilities' conditions

In this concept the space of a conventional intermediate storage with transfer cars and conveyer belts on the ground is used by implementing an additional storage above this level. The two systems are connected by the Westfalia Aviator®.

The HISS Solution Features

- ➔ More storage area and higher performance through the combination of independently working transfer car and Aviator®
- ➔ Increased flexibility and storing capabilities for buildings with low ceiling height, through the usage of multi-deep storage on the upper levels
- ➔ Sorting of short, mid and long-term orders according to order prioritisation
- ➔ Space limitations in layouts are bypass-able through building into the height
